SolarShare — Market Need & Market Area

Version: 1.0 | **Companion to:** PRD v1.0 | **Date:** August 2026

---

1. Market Need

1.1 The supply side is scaling faster than the monetization mechanism

India's residential rooftop solar programme, **PM Surya Ghar: Muft Bijli Yojana**, has grown from roughly 7,000 installations a month before its 2024 launch to **over 3 lakh installations a month by mid-2026**, crossing **50.06 lakh beneficiary households in July 2026** and targeting **75 lakh households by December 2026**, en route to a **1 crore household** target by FY 2026–27. Over ₹28,000 crore in subsidies has already been disbursed. National solar capacity has crossed **150 GW**.

1.2 Existing monetization is real but inefficient

This is not a hypothetical opportunity — households are already earning from surplus solar today. In FY 2024–25 alone, **more than 12 lakh households collectively earned ₹421 crore** by selling surplus power back to DISCOMs under standard net metering. That figure demonstrates genuine, growing demand for a way to monetize solar surplus — but net metering caps the return at the DISCOM's feed-in tariff, well below what a direct buyer would pay.

1.3 The enabling infrastructure is already being built — by the government

Two infrastructure preconditions for P2P trading are both mid-rollout:

- **Smart/net metering:** India had installed **7.24 crore smart meters by June 2026**, against a **25 crore (250 million)** target under the Revamped Distribution Sector Scheme (RDSS), which runs through March 2028. All net-metered rooftop solar connections require CEA-compliant bidirectional smart meters.
- **The trading mechanism itself:** The Ministry of Power's **India Energy Stack (IES)** — built on the open-source, India-made Beckn Protocol (the same protocol family behind ONDC) — went from concept to a **live, PM-witnessed demonstration on 16 February 2026**, with DERC

and UPERC approving a **six-month regulatory pilot** the same month, covering roughly **1.25 crore consumers** across three DISCOMs (BSES Rajdhani, Tata Power Delhi, and PVVNL in western UP).

1.4 Why this validates SolarShare specifically

The IES pilot is infrastructure — a protocol, a registry, a regulatory green light. It explicitly requires third-party consumer applications (Beckn Application Providers) to reach actual households; **Pulse Energy's SUPEREV app** is the first authorized Trade Platform Provider, but its base is EV-charging users, not residential housing societies. This leaves the **housing-society / closed-community segment largely unaddressed** — precisely SolarShare's target entry point.

2. Market Sizing

2.1 Top-down: Global & India P2P energy trading

- The global peer-to-peer energy trading platforms market was valued around **$556 million in 2024**, projected to reach **$10.4 billion by 2034** (~34% CAGR) — driven by blockchain,

smart contracts, IoT, and Virtual Power Plant adoption.

- A broader market estimate places global P2P energy trading at **$9.3 billion in 2025**, growing to **$38.6 billion by 2034** (17.2% CAGR), with **Asia-Pacific already the largest region** at roughly 38% share.
- India's own solar energy market is valued at **~$41 billion in 2026**, projected to reach **~$539 billion by 2034** — a 37.82% CAGR reflecting the scale of the underlying asset base that P2P trading sits on top of.

2.2 Bottom-up: SolarShare's addressable base

Layer	Size	Basis
TAM (India rooftop solar households, full scheme target)	~1 crore households by FY 2026–27	PM Surya Ghar target
SAM (households in states with	~1.25 crore consumers in current pilot DISCOM areas alone	DERC/UPERC pilot coverage

Layer	Size	Basis
active/likely P2P pilots)	(Delhi + western UP), expanding as more states apply	
SOM (realistic near-term target)	A handful of housing societies (hundreds to low thousands of households) within the pilot zone in Year 1, scaling to tens of thousands by Year 2–3	Implementation Plan Phase 1–3

3. Market Area

3.1 Immediate target geography (Phase 1)

- **Delhi** — BSES Rajdhani Power Ltd. (BRPL) and Tata Power Delhi Distribution Ltd. (TPDDL) service areas, where DERC has waived wheeling

and open-access charges for P2P transactions during the pilot.

- **Western Uttar Pradesh** — Paschimanchal Vidyut Vitran Nigam Ltd. (PVVNL) service area, where UPERC has waived Cross Subsidy Surcharge for interstate pilot transactions.

These two zones are the **only** areas in India with active regulatory clearance for P2P energy trading as of mid-2026, making them the only responsible launch geography for a compliant product.

3.2 Expansion geography (Phase 3+)

States with strong rooftop solar growth and progressive DISCOM digitization are the natural next targets once the DERC/UPERC pilot concludes and a long-term regulatory structure is decided — the pilot itself was explicitly designed to be reviewed after six months to inform exactly this kind of national rollout decision.

3.3 Segment-within-geography targeting

Within any approved geography, SolarShare's go-to-market prioritizes **housing societies and gated communities** over open, individual-to-individual trading — smaller trust radius, a single RWA point of contact for bulk onboarding, and shared local

grid infrastructure that keeps transmission losses minimal.

4. Competitive Landscape (Summary)

Player	Position	Overlap with SolarShare
Pulse Energy (SUPEREV app)	Authorized IES Trade Platform Provider; core base is EV charging, now extending into P2P energy	Direct competitor at the infrastructure level, but different primary user base (EV owners vs. housing societies)
Power Ledger	Global P2P energy trading pioneer (Australia-origin)	Indirect — not currently India-focused at the residential-society level
Standard DISCOM net metering	The default status quo for every rooftop	The real "competitor" SolarShare must

Player	Position	Overlap with SolarShare
	solar owner today	beat on price and simplicity

5. Why Now

Three independent timing signals converge in 2026: **(1)** rooftop solar adoption has crossed a critical mass (50+ lakh households and accelerating), **(2)** the smart-metering backbone required for any trading mechanism is now past 7 crore installations nationally, and **(3)** the government itself has built and live-demonstrated the trading protocol, with the explicit stated intent of onboarding third-party apps. Entering during an active, still-narrow regulatory pilot — rather than waiting for a mature, crowded national rollout — is the core timing thesis behind SolarShare's go-to-market.
